

A storage tale from the 3rd world of IT

A story about real world and shadow storage

... and the other one's a fish!

TECH.UNPLUGGED

I live in the third world of IT

Strategy (and tactics)

We live in an All-Flash world... Really?!

	GB	\$	\$/GB	\$/IOPS	IOPS/GB
2,5" SAS 900GB HDD	900	350	0,39	2,30	0,17
2,5" SAS 800GB SSD	800	2440	3,05	0,049	62,5
3,5" SATA 6TB Enterprise	6000	298	0,049	2,98	0,016
3,5" SATA 4TB Consumer	4000	150	0,037	1,87	0,02

We live in an All-Flash world...

Updated!

	GB	\$	\$/GB	\$/IOPS	IOPS/GB
2,5" SAS 0.8TB SSD*	800	1699	2,12	0,021	100
3,5" SATA 8TB SMR*	8000	239	0,029	2,39	0,012

*Amazon 9/16, Sandisk Lightning Ascend Gen.II Vs. Seagate Archive HDD 8TB – FYI 4TB Optimux Max = 1,61 \$/GB

$\$3,05 \rightarrow \$2,12 = -30\%$

$\$0,037 \rightarrow \$0,029 = -20\%$

**And we are piling up a
lot of Trash!**

Where are we going?

Storage as we usually represent it

Storage when we buy it

\$\$\$\$\$\$\$

\$

What does it really mean?

**10/20%
capacity**

**50%
\$\$\$**

What do we ask to storage?

Primary

Latency

Secondary

Capacity

Local Performance

Distributed Performance

How do we get it?

Again, tape is not dead!

“76000PB Total #LTO #tape media capacity shipped in 2015, an increase of 17.8% over prior year.”

Storage as we (traditionally) map it

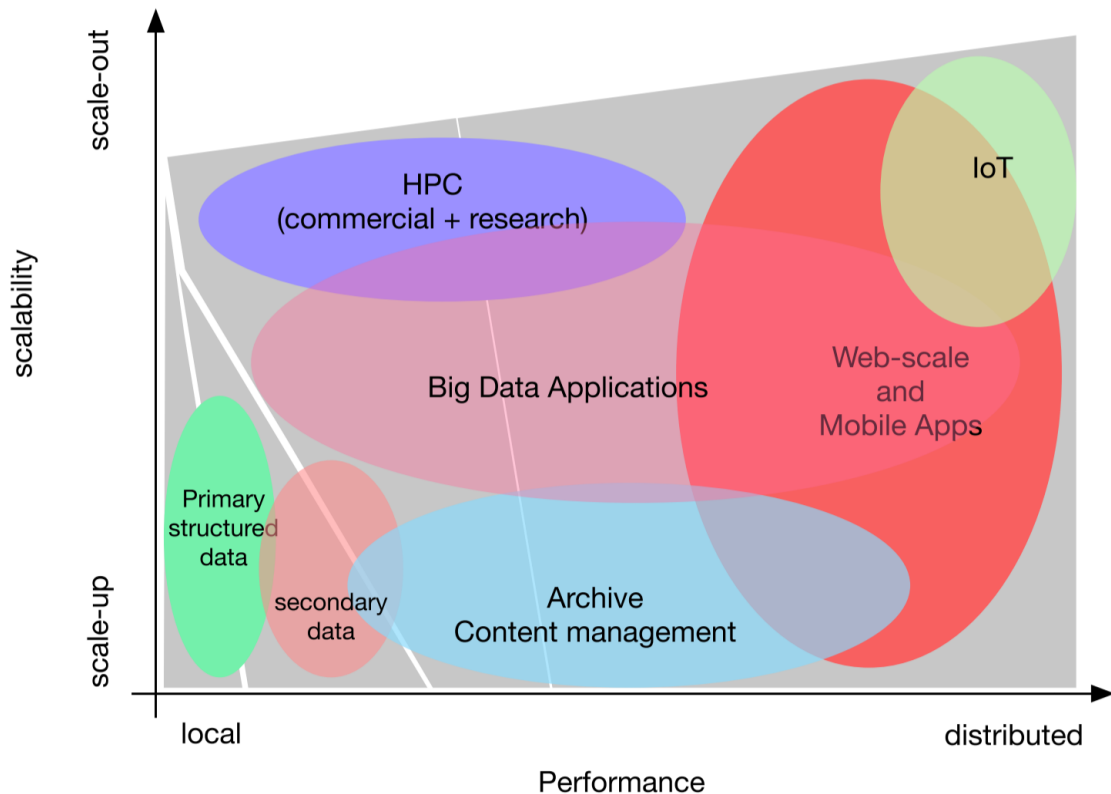

T0

T1

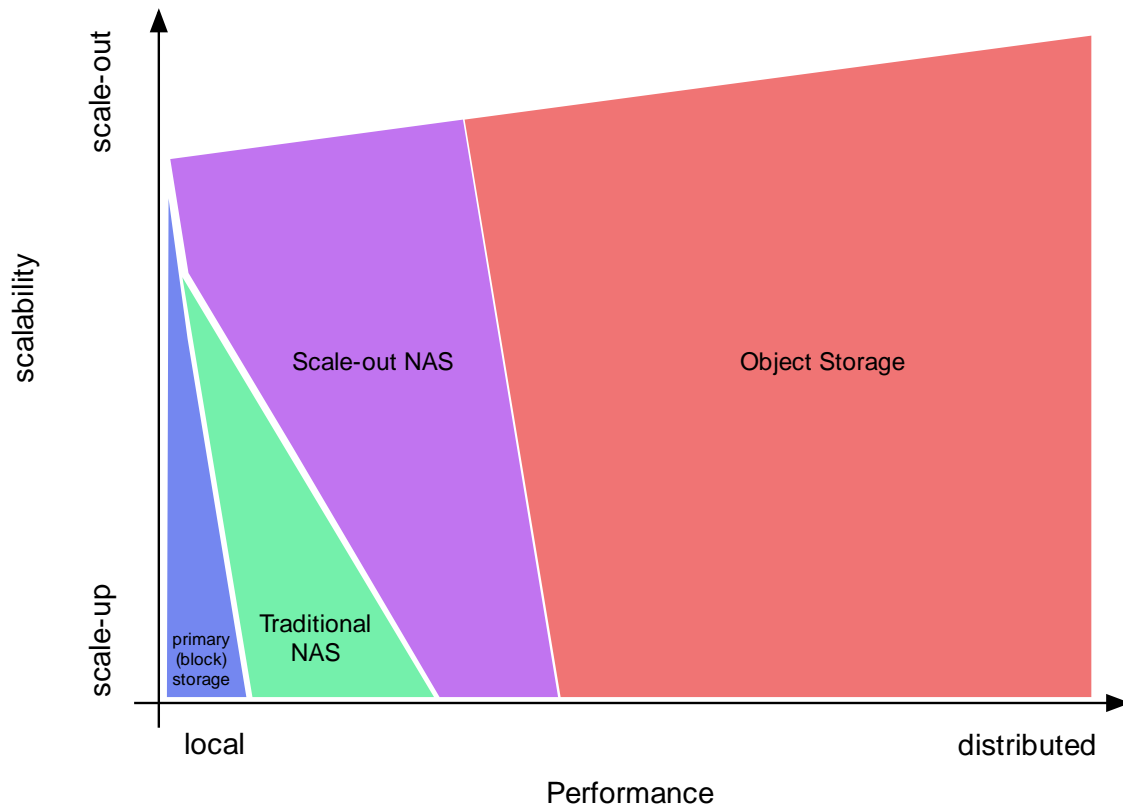

T2

T3

Storage as it should be mapped

Storage as it should be mapped

Mapping media (today)

Where is the story?

\$/GB

cent/GB

TBs/SysAdmin

PBs/SysAdmin

Defining Software-define

Strategy?

No, survival instinct!

***“800TB out of decommissioned
servers”***

Invisible or Shadow storage?

~~UN~~AWARE

I asked around...

**Most OBS
enterprise
customers
start well
under 200TB!**

Key takeaways

- All-Flash DC? Not yet!
- A two tier infrastructure is inevitable
- Look for \$/GB or low latency
- S3 is the protocol (even for tape)
- Look for Primary/Secondary storage integration
- Secondary storage will become smarter

Thank you!
